Future Direction

- User login for the deployment website
- Automatic token injection for the dashboard website
- AI task workflow kickoff
- Exposing multiple ports via ingress controllers

User Stories

- As an admin of the deployment website, the user should have a login for the deployment website to view only their deployments instead of the entire namespace.
- As an external user, the user shouldn't be tasked with copying and pasting the token key for the Kubernetes dashboard and should rely on an automatic token injection for the dashboard website.
- A research user should be able to kickoff an AI task workflow through the deployment website through another tab as done with for the process of deploying a website.
- The admin user should be able have the ability to expose multiple ports via ingress controllers so that external customers are able to view the deployments outside of the LAN.
